

FOUNDATION

It is critical that every vibratory feeder bowl system is provided a solid and stable foundation to insure maximum efficiency when handling parts. All rubber insulated feet, supports and fixtures should be securely fastened to their intended mounting points with the appropriate hardware.

Anti-vibration feet insure that the unit will perform efficiently and will prevent the machine from “walking”, vibrating out of position.

No vibratory feeder system is intended to operate while fixed or placed on shipping pallets, skids or crates.
